For more information	Contact <u>eeshelpdesk@eaton.com</u> with details of the product.

Introduction

This application note details how to effect the hold – down installation of a 93PS20 UPS on a concrete floor to comply with seismic certificates 7710 and 7620 (refer appendices)

Assumptions

- 1. Centre of mass is located as indicated in the document "Eaton 93PS20 GA" (refer appendix)
- 2. The proposed UPS units, or associated fixings, are not installed over a building movement Joint
- The UPS units are installed in accordance with the clearance requirements outlined within the design report for "Seismic and post disaster response building engineering services- BSEDRE-000-001 ':
- 4. Anchor fixings are located to avoid all reinforcement and post-tensioning ducts within the floor slab. Eaton recommend that the concrete floor slab is scanned with a ground penetrating radar, or similar, to set out the location of the required fixings. Strictly no reinforcement is to be cut without prior written approval by the main building structural engineer.
- 5. All fitments, nuts and bolts to be hot dip galvanised to AS 4680 or zinc plated
- 6. The UPS units are installed within a very low (Category A) atmospheric environment, in accordance with AS 2312.
- 7. The concrete floor slab has a minimum thickness of 150mm
- 8. The concrete slab and wall has a compressive strength of at least f'c=32MPa
- 9. Chemical anchors are installed in accordance with the manufacturer's specifications.
- 10. Chemical anchors are rated for seismic loading in cracked concrete.
- 11. The edge distance between the centre of any anchor and the nearest concrete edge is at least 200mm

If any of these criteria are not met on site, the capacity of the anchors may be compromised and the seismic restraint may not meet the design requirements. Please notify Eaton if any of the site conditions vary from the design assumptions.

93PS20 Hold-Down installation

Unpacking and unloading the UPS

Before you start to unpack and unload the UPS, check the TipNTell / DropNTell indicator on the package surface (see step 2 below). If the equipment has been correctly transported in the upright position, the indicator should be intact. If the indicator arrow has turned all blue, contact the appropriate parties to report inappropriate transportation.

WARNING

The UPS cabinet is heavy. If the unpacking instructions are not closely followed, the cabinet may tip over and cause serious injury.

Do not tilt the UPS cabinet more than 10 degrees from the vertical or the cabinet may tip over.

For transportation purposes, the UPS cabinet is bolted onto a wooden pallet. To remove the pallet, perform the following procedure:

Bolting down the UPS

Once the cabinet is in the required position with the hold-down brackets touching the floor you are ready to boltdown

13.	Insert Ramset C8 Resin into the hole using Ramset applicator Fill hole to 3/4 the hole depth ensuring no air pockets form Insert M10 Ramset Chemset Anchor Stud turning the stud as it is inserted			3	
14.	Allow the EPCON C8 resin with stud inserted time to cure (set). Curing/setting times are shown in the table	Setting Time	es EPCON™	C8 Curina time in	Curing time in
		base material	Gel Time	dry concrete	wet concrete
		5°C - 9°C	20 min	30 h	60 h
		10°C - 19°C	14 min	23 h	46 h
		20°C - 24°C	11 min	16 h	32 h
		25°C - 29°C	8 min	12 h	24 h
		30°C - 39°C	5 min	8 h	16 h
		40°C	5 min	6 h	12 h
15.	When the EPCON C8 Resin has cured/set attach the washers and nuts. Note: Nuts have a tightening torque of 20NM Hold - down is complete when all six studs (3 Front and 3 Rear) have been installed			-

<u>(</u>	ERTIFICATE of DESIGN COMPLIAN	CE 93PS20	UPS	
Certificate No:	07620	<u>CE 93PS20</u>	<u>UPS</u>	
Certificate No: Issued by :	CERTIFICATE of DESIGN COMPLIANC 07620 Lance Kennedy Hope	<u>CE 93PS20</u>	<u>UPS</u>	
Certificate No: Issued by : Issued to :	ERTIFICATE of DESIGN COMPLIANO 07620 Lance Kennedy Hope Eaton Industries Company	<u>CE 93PS20</u>	<u>UPS</u>	
Certificate No: Issued by : Issued to : In respect of :	CERTIFICATE of DESIGN COMPLIANC 07620 Lance Kennedy Hope Eaton Industries Company 93PS20 UPS	<u>CE 93PS20</u>	<u>UPS</u>	

I believe on reasonable grounds that :-

(i) Subject to all proprietary products meeting their performance specification requirements;

(ii) And when fabricated in accordance with the drawing specified above;

(iii) And when the supporting floor is designed to withstand forces imposed by the 93PS20 UPS;

That the Eaton 93PS20 UPS complies with the requirements of NZS4219:2009 Seismic Performance of Engineering Systems in Buildings for a maximum lateral force coefficient of C = 2.0 when used in conjunction with a properly installed seismic anchorage system with minimum tensile and shear ratings of:

Tension =
$$8.9 \text{ kN}$$

Shear = 2.4 kN

An example of such a system would be the use of six Ramset Chemset Epcon C8 Anchors with M10 Chemset Anchor Stud Grade 5.8 Carbon Steel, drilled hole depth to be 70 mm.

At a lateral force coefficient of C = 2.0 the maximum Zone Factor (Z) is related to Importance Level (IL) and installation elevation by the following table:

	Ground Level	Above Ground
IL 1	0.97	0.29
IL 2	0.87	0.29
IL 3	0.67	0.22
IL 4	0.48	0.16
