Intelligent devices

SHC 2.5 added support for "intelligent devices". With the "intelligent device" concept you can integrate selected external or virtual devices to your home automation system.

The values from intelligent devices can be sent in notification messages or used as triggers in macros.

For example, you can enable or disable an xComfort actuator based on a value read from the virtual Weather Station.

Supported devices

Virtual Weather Station

The Weather Station provides local weather status using a remote weather service API from Weather Unlocked and your location info as defined in your SHC in System/Time Zone.

To use it you need to create an account with Weather Unlocked weather service:

- https://developer.weatherunlocked.com/signup

With the Weather Station you can get information on:

- cloudiness
- humidity
- pressure
- temperature
- wind speed

To install the virtual Weather Station, use the voucher "WeatherService_v1" in the Activate Coupon field in *Diagnostics/System Status* in Web Admin.

Then go to the *System/Intelligent devices* tab and click *Add* to add the weather station. **Please check and follow the instructions provided when clicking the Help button** in the same tab.
