

Fluid purifier systems and
oil service equipment

EATON

Powering Business Worldwide

Eaton combines sales, engineering, manufacturing, customer service and technical sales support into one focused business provide customers with optimum filtration solutions.

Eaton is continually striving for improvement, with integrity as an underlying business strategy that forms the trademark of all its products and services. Eaton is one of the leading manufacturers of products and solutions for filtration combining measurement, diagnostic and analysis technology, as well as more than 4,000 hydraulic filter elements and corresponding filter housings.

Filtration of cooling, hydraulic and lubricant fluids

- Stationary off-line filter units
US series
- Mobile off-line filter units
UM series
- Mobile off-line fluid cleaning systems
IFPM series

Improve the reliability of the entire system's equipment and prolong fluid service life by reducing solid and water contamination, maintaining lubricity and slowing fluid aging.

Oil service equipment for hydraulic and lubrication systems

An in-line filter is generally sufficient for use in hydraulic and lubrication systems. When filling for the first time, changing the oil, flushing, or for machines with a discontinuous volume flow, Eaton recommends additional off-line filtration.

To ensure optimum operation, flushing must be performed before initial start up in stationary and mobile hydraulic and lubrication systems.

Eaton's oil treatment systems simplify offline filtration and help save costs new oil, maintenance and replacing components.

Features of off-line filter units

- Reliable and simple off-line filtration
- Reinforces existing operating in-line filter
- Improves cleanliness classes
- Longer service life of system components and operating fluids
- Compact design saves space and adapts to your operation
- High-quality filter elements with high dirt holding capacity
- Filter elements can be replaced tools or system downtime
- Safety valves permit unattended operation
- Uninterrupted filtration during tank filling
- Optional use of water-absorbing filter elements

US series stationary off-line filter units

The stationary filter units in the US series are used for the fine filtration, filling or flushing of hydraulic systems. The filter units are equipped with a gear pump driven by an electric motor. They are available for various volume flow rates, in different sizes, and with different micron ratings for the required fluid cleanliness.

The filter units in the USP series have an additional plate heat exchanger to clean and cool the hydraulic or lubricating oils. A number of tests have shown that lowering the temperature by 10 °C doubles the service life of hydraulic oil. Lower oil temperatures also prevent damage resulting from thermal decomposition, such as seal failures and decreases in film thickness on the surfaces of hydraulic components (such as valves and cylinders), which could lead to unscheduled system outages.

UM series mobile offline filter units

The mobile filter units in the UM series combine the convenience of the US filter units with mobile oil treatment in hydraulic and lubrication systems.

The filter units in the UMP series have a pneumatic double diaphragm pump instead of an electronic gear pump, and are suitable for explosion proof applications (Ex II 2 G/D c IIA T5).

During off-line filtration, the filter operates in a cycle that is separate from the main system. By separating the systems, off-line filtration can take place independently of the system's running time until the desired fluid cleanliness is reached.

Removal of water, gases and solid contaminants using fully automated compact systems.

Eaton fluid purifier systems remove free, emulsified and dissolved water, free and dissolved gases, and solid contaminants. They have been developed for different viscosity ranges, from transformer to heavy gear lubricating oils. The selection of the micron rating used depends on the required fluid purity. The mobile fluid cleaning systems in the IFPM series are available in two standard sizes with flow rates of 30 l/min and 70 l/min.

Effects of water contamination

Water is one of the most frequently occurring contaminants and is second only to particulate contamination as a destructive foreign substance in a system. Some of the problems and damage water contamination can cause include:

- Shortened service life of the fluid
- Reduced performance of the lubricating fluid
- Heavy wear to the components
- Loss of polarizing additives
- Rust
- Increased conductivity

IFPM fluid cleaning system technology

Vacuum evaporation with inert gas is the most effective water removal method for fluid cleaning systems. This method combines high water separation rates with an efficient use of energy, and allows the drying process to take place even below the saturation point of the prepared fluid. By contrast, conventional vacuum evaporation only brings the water content of the fluid to the same level as that of the water vapor in the surrounding atmosphere.

The IFPM fluid purifier systems are fully automated, PLC-controlled compact enough for use in confined areas. The WSPS 05 sensor permanently monitors the water saturation in a purified fluid. A ventilation filter with silica gel dries the inflowing air, increasing the efficiency of the cleaning system even in environments with high humidity levels. The VS5 electronic contamination sensor provides the optimal use and maintenance scheduling of the particle removal filter element.

Operating principle

- The contaminated fluid is drawn into the fluid cleaning system using a vacuum
- The fluid passes a heater, which raises the temperature in order to increase the water removal process
- Fluid reaches the vacuum chamber through a two-port magnetic valve
- The dispersion material in the vacuum chamber increases the fluid's evaporation surface area
- The vacuum decreases the water evaporation temperature, converting free water and water dissolved in the fluid into steam
- Ambient air enters through a ventilation filter and passes through the fluid against the direction of flow, acting as a carrier medium for the steam produced
- The humid air enters a vacuum pump and released into the atmosphere using an oil mist separator

IFPM 32

Web-enabled control unit with touch panel and USB interface

Factors affecting system efficiency

The processing time required to reach an acceptable water content level is primarily dependent on the fluid type. Other factors affecting the speed of the drying process are listed in the following table.

Parameter	Water removal rate
Temperature:	Greatly increased
Vacuum:	Increased
Initial water content:	Increased
Additives:	Reduced
Flow rates:	Increased

Chart of water content over time for various fluids

Technical Data	IFPM 32	IFPM 72
Operating parameters:		
Power supply options:	380 to 415 V AC/50/60 Hz/9.4 A/5.1 kW or 440 to 480 V AC/60 Hz/9.1 A/5.4 kW	380 to 415 V AC/50/60 Hz/17.9 A/10.8 kW or 440 to 480 V AC/60 Hz/15.7 A/10.6 kW
Protection class:	IP 54	IP 54
Max. intake pressure:	≤ 0.2 bar	≤ 0.2 bar
Viscosity:	12 to 700 mm ² /s	12 to 700 mm ² /s
Fluid temperature:	10 to 80 °C	10 to 80 °C
Ambient temperature:	0 to 40 °C	0 to 40 °C
Intake connector:	SAE flange 3.81 cm	SAE flange 3.81 cm
Outlet connector:	SAE flange 3.175 cm	SAE flange 3.175 cm
Volume flow*:	28.5 l/min	70.3 l/min
Water removal rate**:	22 l/day	54 l/day
Measurement parameters:		
Water saturation:	0 to 100%	0 to 100%
Temperature:	-25 to 100 °C	-25 to 100 °C
Pressure (vacuum chamber):	-1 to 0 bar (relative)	1 to 0 bar (relative)
Filter contamination:	50 to 100%	50 to 100%

* With a fluid viscosity of 32 mm²/s ** Free water at 60 °C and 32 mm²/s
