

# How to select the correct size DS7 soft start controller

## Application

The DS7 is a two phase control soft start controller utilized to accomplish motor starting using the reduced voltage method. Typically, the motor Horsepower or kW rating is used to determine the minimum required size of the soft start controller. This document addresses ramp time (T-Start) and start voltage (U-Start) parameters that require consideration in accomplishing the proper match of soft start controller to the load.

## Overview

Soft start controller sizing is typically determined beginning with the Horsepower or kW rating of the motor, coupled with the mains operating voltage. Using this information, a table or graph is consulted to factor in the starting time (t-Start) to determine the minimum size soft start controller that is appropriate for the application. If the application is considered to be severe duty due to a higher current inrush and/or longer starting time, it is commonplace to select a larger rated soft start controller to accommodate the higher loading on the SCR's.

The graphs and tables published for the DS7 are based on an inrush value of 300% FLA or 400% FLA of the motor. A NEMA category B motor that is very common will demonstrate a 300% current rise during the start under normal conditions. If the actual inrush current approaches a value of 400% FLA as would be the case with higher NEMA Motor Code Letters, the maximum allowable ramp times are significantly affected. The t-Start starting time must be seriously considered and kept as short as practical (5 seconds). As the start time parameter is increased, the maximum allowable current capacity is decreased. When selecting the size of the DS7 soft start controller, Tables 4 - 7 may be used if the anticipated starting time is 10 seconds or less. Please note that either 300% or 400% Current Limit refers to the maximum anticipated start current in terms of motor FLA (3x or 4x). The DS7 does not have a current limiter function. If the starting time is expected to be longer, Tables 8 - 14 should be reviewed to ensure that the soft starter is not subjected to excessive current resulting in SCR failure. The size of the soft start controller may be required to be increased specifically due to a longer ramp time.

**Note:** The DS7 Soft Start controller may be incorrectly sized if based solely on motor Horsepower or kW rating and mains voltage alone.

**The DS7 Soft Starter requires that specific attention is given to two factors:**

- Ultimate load** – the maximum inrush current that the soft start controller will transmit anytime during the start process.
- Ramp time** – the expected, or required, starting time required for the motor to achieve synchronous speed.

**Example 1**

7.5HP Motor (11A FLA) Motor Code Letter B @ 460V Application, with an estimated starting time time of 8 seconds and 4 starts per hour.

First, the locked rotor current (LRC) is used to determine the initial current rise when the motor is energized. This information may be noted on the Motor Nameplate. If the LRC is not indicated on the nameplate, the LRC may be calculated from the formula shown in Equation 1. Calculations indicate an LRC range of 29.1 - 33.4 amps. A 300% current rise for this motor yields 33 amps ( $3 \times 11$  amps), so the 300% Current Rise Table will be used for basic product selection. Consulting Table 4, the DS7-340SX012N0-N soft start controller shows an acceptable maximum motor size of 7.5HP. Please note that Tables 4 thru 7 indicate maximum allowable start ramp times of 10 seconds @ 1 start/hr for these selections. Consulting Table 11 and/or Figure 4, the maximum allowable start current is noted as 36A, @ 8 second start time. If needed, the starting time could be increased to 10 seconds as the maximum allowable start current is 33.6 amps. Under these conditions, a DS7-340SX012N0-N soft starter is the appropriate selection for this application.

**Example 2**

With the same operating conditions as in Example 1, it is determined that the starting time must be extended to 12 seconds for the motor to achieve synchronous speed. Consulting Table 11 and/or Figure 4, the maximum allowable start current for 12 seconds is indicated as 31.2 amps, less than the required 33A ( $3 \times 11$  amps). Under these conditions, the DS7-340SX012N0-N soft start controller would not be an appropriate selection. Table 12 and/or Figure 5 for the next higher size unit, lists the maximum allowable start current @ 12 seconds as approximately 36.8A. If needed, the starting time could be increased to 15 seconds as the maximum allowable start current is 33.6 amps. Under these new conditions, the next size higher soft start controller, DS7-340SX016N0-N is the suitable choice, as the maximum allowable start current for these conditions is sufficient for proper operation.

**Example 3**

With the same operating conditions as in Example 1, it is discovered that the Motor Code Letter is "D" instead of "B". Using Equation 1, the LRC current is 37.7 to 42.3 amps, so Table 5 (400% current rise) will be used for basic product selection.

Table 5 indicates the DS7-340SX016N0-N is the appropriate selection for this 7.5 hp motor. Consulting Table 12 and/or Figure 5, the maximum allowable start current for 8 seconds is 46.4 amps.

Please note that this product selection is at the maximum allowable starting time. Consulting Table 12 and/or Figure 5 shows the maximum allowable current for a 9 second start time is 43.2 amps. A larger soft start controller, the DS7-340SX024N0-N should be seriously considered if the starting time may exceed 8 seconds.. This operating condition will also require a larger capacity unit (DS7-340SX016N0-N) to accommodate the higher operating current (44 amps) during the starting time.

**Note:** Examples 1 - 3 refer to LRC values at full mains voltage. Please keep in mind that these values are very close to the ultimate maximum rating of the SCR's. Setting the U-Start potentiometer to settings below 100% will lower the currents and extend the service life of the unit. Eaton does not recommend DS7 soft start controller sizing based on U-Start settings below 100%.

**Control Voltages for the DS7**

---

DS7-340SX...N0-N = 24 Vac/Vdc Uc

---

DS7-342SX...N0-N = 120/240 Vac Uc

---

DS7-34DSX...N0-D = 24 Vdc Uc

### Determining initial current based on locked rotor current

The National Electrical Code requires that all alternating current motors of 1/2 horsepower and higher must have code letters on the data plate indicating motor current in a locked rotor condition. This code denotes the Kilovolt-Ampere per horsepower of the motor. The KVAhp value is obtained from NEMA and/or NEC publications. The table below is provided as a reference. Locked rotor current of a three phase motor may be calculated using the following formula:

**Equation 1:** Calculating Locked Rotor Current (LRC):

$$\text{Locked Rotor Current} = \frac{\text{Horsepower} \times \text{KVAhp} \times 1000}{E \times 1.73}$$

### Example 4

To calculate the locked rotor current range of a 50 horsepower motor operating at 460 volts with a code letter B, proceed as follows;

$$\text{Locked Rotor Current} = \frac{50 \times 3.15 \times 1000}{460 \times 1.73} = 197.91 \text{ Amperes}$$

(minimum)

$$= 197.91 \text{ Amperes}$$

$$\text{Locked Rotor Current} = \frac{50 \times 3.54 \times 1000}{460 \times 1.73} = 222.42 \text{ Amperes}$$

(maximum)

$$= 222.42 \text{ Amperes}$$

**Table 1. Motor Code Letter Locked Rotor kV-Amp / hp**

Code Letter	Motor Code Letters	
	Locked Rotor Kilovolt-Ampere per hp	
	Minimum	Maximum
A	0	3.14
B	3.15	3.54
C	3.55	3.99
D	4.00	4.49
E	4.50	4.99
F	5.00	5.59
G	5.60	6.29
H	6.30	7.09
J	7.10	7.99
K	8.00	8.99
L	9.00	9.99
M	10.00	11.19
N	11.20	12.49
P	12.50	13.99
R	14.00	15.99
S	16.00	17.99
T	18.00	19.99
U	20.00	22.39
V	22.40	22.41

**Note:** The current in the motor circuit will be subject to the total impedance of the motor circuit, so actual values may be slightly different than calculated values.

### DS7 Parameterization

To determine the expected Initial Current value after determining the locked rotor current, apply the corresponding current reduction value based on the U-Start setting of the soft start controller in Table 1. Selecting a value of 53 (4th increment mark), the expected current will be 53% of the above values, or 104.89 amps to 117.88 amps respectively. Please note that the motor will develop approximately 28% of full voltage torque which is very similar to the starting current of a wye-delta configuration.

**Note:** The values in Table 1 correspond to the increment marks on the U-Start potentiometer.

**Table 2. U-Start Initial Current**

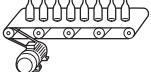

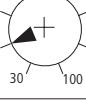

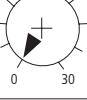

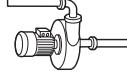

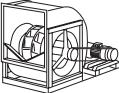

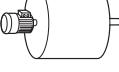

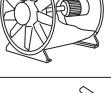

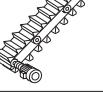

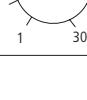

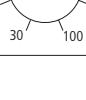

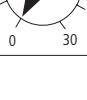

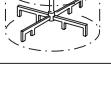

U-Start Settings		
U-Start	Current %	Torque %
100	100	100
93	93	86
85	85	72
77	77	59
69	69	47
61	61	37
53	53	28
45	45	20
37	37	14
30	30	9

The diagrams below show various potentiometer settings that have proven to be effective for standard application in real-life environments.

**Examples**

The following default settings are recommended for an application:

**Table 3. Parameterization Examples**

			Application examples	
-10 	-30 	0 		J → 0 Low flywheel mass
-25 	-30 	-30 		Conveyor belt with loose belt
-20 	-40 	0 		Roller conveyors
-10 	-30 	-20 		Centrifugal pump
-15 	-40 	0 		Fan general (building) with belt drive
-18 	-40 	0 		J → 0 ∞ High flywheel mass → DS7 > P <sub>Motor</sub>
-15 	-50 	0 		Tunnel fan Axial fan → DS7 > P <sub>Motor</sub>
-10 	-60 	0 		Bulk conveyor Escalator
-10 	-60 	0 		Mixers Agitators → DS7 > P <sub>Motor</sub>
