1 INTRODUCTION

1.1 Model Explanation and Peripherals

Thank you for choosing Eaton Logic Controller (ELC) series products. The ELC-AN06AANN allows the connection of four analog inputs and 2 groups 12 bits digital outputs (voltage/current). The ELC transforms the input into a 12 bit digital signal and the output into a 2 points analog signal, which may then be manipulated using TO and FROM commands in the ladder logic program. There are 49 Controlled Registers (CR) in each module (each register is 16 bits). The Analog Input/Output Mixed Module of ELC-AN06AANN can read/write the data of analog input module by using commands FROM / TO via ELC program.

Explanation:

1. CR#0: The ELC model type.
2. CR#1: b11~b0 is used to set 4 inner channels working mode of analog input module (AD). b12~b15 is used to set 2 channels working mode of analog output module (DA). Every channel has four modes to set and can be set individually. For example: if setting CH1 to mode 0 (b2~b0=000), CH2 to mode 1(b5~b3=001), CH3: mode2 (b8~b6=010), CH4: mode 3(b11~b9=011). It needs to set b0~b11 to H688. If setting CH5: mode 2 (b13~b12=10), CH6: mode 1 (b15~b14=01), it needs to set b12~b15 to H5. The factory setting is H0000.
3. CR#2 ~ CR#5: Used to set the number of input readings used for the average temperature calculation. The available range is K1~K100 and factory setting is K10.
4. CR#6 to CR#9: they are used to save the average value of input signal of CH1~CH4.
5. CR#10 ~ CR#11 are used to set the output value of CH5 and CH6. The setting range is K0~K4,000. The factory setting is K0 and unit is LSB.
6. CR#12 ~ CR#15: they are used to save the present value of input signal of CH1~CH4.
7. CR#16, CR#17, CR#28, CR#29 are reserved.
8. CR #18~ CR #21: the content is the value of adjusting OFFSET value of CH1~CH4 if analog input voltage or current is 0 after it transfers from analog to digital. Voltage setting range: -5V~+5V(-1,000$_{LSB}$~+1,000$_{LSB}$). Current setting range: -20mA~+20mA (-1,000$_{LSB}$~+1,000$_{LSB}$).
9. CR #22~ CR #23: the content is the value of adjusting OFFSET value of CH5~CH6 if analog input voltage or current is 0 after it transfers from analog to digital. The factory setting is K0 and the unit is LSB. The setting range is -2,000~+2,000. Voltage setting range: -5V~+5V(-2,000$_{LSB}$~+2,000$_{LSB}$). Current setting range: -10mA~+10mA (-2,000$_{LSB}$~+2,000$_{LSB}$).
10. CR #24~ CR #27: That is the value of adjust GAIN value of CH1~CH4. That is the value of analog input voltage or current when conversion value from analog signal to digital is 4,000. Voltage setting range: -4V~+20V(-800$_{LSB}$~+4,000$_{LSB}$). Current setting range: -16mA~+52mA (-800$_{LSB}$ ~+2,600$_{LSB}$). But it needs to notice that GAIN VALUE – OFFSET VALUE = +200$_{LSB}$~+3,000$_{LSB}$ (voltage) or +200$_{LSB}$~+1,600$_{LSB}$ (current). When this value under this range, the resolution of the input signal will be thin and the variation of value will be larger. When this value exceeds this range, the resolution of input signal will be thick and the variation of value will be smaller.
11. CR #28~ CR #29: That is the value of adjust GAIN value of CH5~CH6. That is the value of analog input voltage or current when conversion value from analog signal to digital is 2,000. Voltage setting range: -4V~+20V(-1,600$_{LSB}$~+8,000$_{LSB}$). Current setting range: -8 mA ~+40 mA (-1,600$_{LSB}$~+8,000$_{LSB}$). But it needs to notice that GAIN VALUE – OFFSET VALUE = +400$_{LSB}$ ~+6,000$_{LSB}$ (voltage/current). When this value under this range, the resolution of the input signal will be thin and the variation of value will be larger. When this value exceeds this range, the resolution of input signal will be thick and the variation of value will be smaller.
12. CR#30 is fault code. Please refer to the following chart.

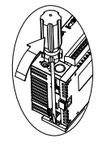
5 INSTALLATION & WIRING

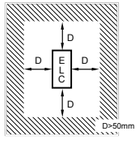
1. Installation of the DIN rail

The ELC can be secured to a cabinet by using the DIN rail that is 35mm high with a depth of 7.5mm. When mounting the ELC on the DIN rail, be sure to use the end bracket to stop any side-to-side motion of the ELC, thus to reduce the chance of the wires being pulled loose. At the bottom of the ELC is a small retaining clip. To secure the ELC to the DIN rail, place it onto the rail and gently push up the clip.

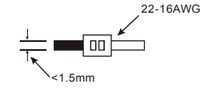
To remove it, pull down the retaining clip and gently pull the ELC away from the DIN rail. As shown on the right:

When installing the ELC, make sure that it is installed in an enclosure with sufficient space (as shown on the right) to its surroundings so as to allow heat dissipation.





2. Wiring



Notes:

1. Please use 22-16AWG (1.5mm) wiring (either single or multiple core) for I/O wiring terminals. The specification for the terminals is as shown on the left. ELC terminal screws should be tightened to 1.95 kg-cm (1.7 lb-in). Use Copper Conductor Only, 60/75 °C.
2. I/O signal wires or power supply should not run through the same multi-wire cable or conduit.

6 INITIAL ELC START-UP

Lamp display:

1. Upon power-up, the ERROR LED will light for 0.5 seconds the POWER LED will light continuously.
2. No errors= POWER LED on and ERROR LED off.
   Low Voltage error (lower than 19.5V), ERROR LED will blink continuously till the power supply rises above 19.5V.
3. ELC-AN06AANN connected to ELC in series = RUN LED on MPU will be lit and A/D

LED or D/A LED should blink.

4. After receiving the first RS-485 command the A/D LED or D/A LED will blink.
5. If the input or output exceeds the upper or lower bounds, then the ERROR LED will blink.
6. When main ELC and extension unit communicate time-out or abnormal interrupt, LED ERROR of extension unit will keep lighting.
