

## Installation notice for Eaton PowerWave 2 rails

With the introduction of our new, rugged C-Clip design, care must be taken during installation to ensure rails are being placed in the correct orientation (left-hand vs. right-hand). When being assembled, the installer will have the neutral on the straight rail facing them. The side plate must be closest to the end of bus rail with the c-clips behind it to allow for coupler installation.

Notice on the correct alignments, the side plate can slide over the bus bars without being impeded by the c-clips while on the incorrect alignments, the side plate is not able to slide over the bus bars because of the c-clips, which will not allow for coupler install.
