

# THREE NEW UPDATES IN FORESEER

changing the face of power management

Wherever there is a need for reliable and efficient power, Eaton's Foreseer® electrical power monitoring software will help manage it better. Foreseer's latest software update helps empower facility management teams to make more intelligent energy management decisions.

## 1 Enhanced Cybersecurity

In our hyper-connected world, trusted environments are a must. That is why Eaton incorporated the latest recommendations from its UL authorized Cybersecurity Center of Excellence lab into the newest version of Foreseer, along with improvements to web access and security. As cybersecurity threats evolve and grow more sophisticated, so do our solutions.

## 2 Customized User Experience

Eaton has always offered high performance trend analysis, graphing and forecasting tools through Foreseer to assess capacity, equipment performance and maintenance requirements. Today, we've added even more customization capabilities into our graphical interface so you can easily translate complex data into big picture insights through intuitive dashboards and navigation.

## 3 Universal, remote connectivity

Remote connectivity is critical for monitoring the status of critical equipment and taking action before there's an impact to uptime or power quality. The latest version of Foreseer includes seamless operation with nearly any Web or mobile browser, along with the ability to send out emails or text message alerts – allowing you to respond instantly so operations are never compromised.

Foreseer is an electrical power monitoring system that connects your operation's vast array of devices, giving them the ability to be monitored—regardless of manufacturer or model—to help you reduce energy consumption and help avoid unplanned downtime due to the failure of critical systems.
